The first version of AutoCAD was only available in the UK and the US, but was soon added to the US\$ 5,000 full version of AutoCAD LT, a version of AutoCAD Lite developed for use on desktop computers. In the early 1980s, programs for drawing and analyzing plans were also available, including Autoplan and Wordplan, but these were generally less widely used than AutoCAD, and were generally used with other drawing applications. With the release of AutoCAD 2000 in 1987, the "Live" (or "On Screen") drafting feature also became available. This lets users create drawings on their screen that are eventually printed, enabling them to work with their drawings in real time while still creating them on screen. This is still a commercial product, however, and as a result, Autodesk is constantly adding new features, functionality and new users. On July 2, 2019, Autodesk released a new version of AutoCAD, AutoCAD 365, which incorporates many new features from AutoCAD 2019, the first major release of AutoCAD in ten years. AutoCAD history As computer-aided design moved to the computer and not the plotter, CAD users began to demand higher levels of interactivity and performance, and the companies responded by releasing the first versions of AutoCAD. Although the graphics commands were simple, the software was still quite complex in terms of workflow, and early users felt that it was difficult to learn and understand. The first AutoCAD was released in 1982. It was released in three editions: AutoCAD (for the UK, US, and Australia), AutoCAD LT (a version of AutoCAD for desktop computers), and AutoCAD LT V1.00 (for use on the DEC Rainbow and Compaq Deskpro computers). The first software release available in Asia was AutoCAD in 1987. An upgrade to AutoCAD 2.0 in 1987 included the ability to edit text on 2D objects. AutoCAD 2.0 was released in 1987. Its capacity to edit text on 2D objects was expanded, and the ability to use labels was added. Other significant features included plans, dimensions, and the introduction of the XYZ datum to enable modeling on multiple geometries. In 1988, AutoCAD 2.5 was released. It included new features such as an integrated 2D drafting workspace and the ability to create 3D models from

2D object base class The 2D object base class (2DBase) is used to represent 2D shapes such as lines and circles. It also supports using 3D model data for its base class. The 2D object base class has two constructors: A constructor which takes a string as a parameter specifying a text string to use as an identifier for the object. This string can be used to find the object in the LISP code. A constructor which takes a 2D vector to use as the center point. To create a new 2DBase object, the constructor is used. ... note:: In C++ or AutoLISP, the AutoCAD ID is typically a constant string which is added to the class name at build time. All 2DBase objects support some basic operations. The AutoCAD object allows drawing to the screen, and editing to set attributes. The 2DBase class also supports generating instances of itself with a repeat count. An AutoLISP function called as a constructor. ... code-block:: lisp (make-2dbase) can be used to create an object with a repeat count of 3. When not using AutoLISP, the 2DBase class is used in a type specifier. This allows passing a type specifier to a command, such as create. In AutoLISP, an equivalent method is used. Type specifiers are defined in the operating system. The specific class is shown in the following table. ... code-block:: lisp (type-specifier,AUTODESK/2DBASE) * 2DBase does not support creating text labels. The following example shows how to create a text label for a 2DBase object: ... code-block:: lisp (create-2dbase-text "Label") When creating the text label, the text string is specified. ... code-block:: lisp (create-2dbase-text "Label") The following code example creates a 2DBase object, then adds it to the "sheet1" layer, and activates it: ... code-block:: lisp (self *layer*sheet1) (make-2dbase) (a1d647c40b

The vast majority of these worlds are in the "Goldilocks zone" of their stars where they are neither too hot, nor too cold for liquid water to exist. So what will we find when we start looking for Earth-like planets around stars in our own galaxy? Is life out there? There are more than 1,200 exoplanets known so far, many of which are potentially habitable. Many of these are super-Earth sized planets which are difficult to characterise in terms of their atmosphere, atmosphere and habitability. The star Image copyright Rosetta/ESA Image caption Rosetta spacecraft in orbit around Comet Churyumov-Gerasimenko Scientists have been able to learn a great deal about the star that is orbiting this small icy world by studying the composition of the comet that the planet is embedded in. The findings reveal that the comet contains a mixture of volatile elements - primarily water and carbon - that have been ejected from the star as it formed. The study also suggests that the protoplanet that forms from this material has more than twice the mass of Earth - that's about 50 billion tonnes, in case you're wondering. What about the planet? Planets come in many shapes and sizes. The jury is still out on some of these strange looking worlds. Image copyright NASA, ESA and M.
