KeyMACRO is a little tool for Windows that can be used for eliminating (or getting rid of) the annoying behavior of Windows such as locking up and crashing in the middle of a work-related activity. Why is it annoying? It usually happens when you open a very big file, such as a set of SAP, Oracle, Access or SQL tables. Your system often runs for a couple of hours with no problem, but then suddenly, it locks up and you have to reboot it. Why is it that a program such as SAP, Oracle, Access or SQL can lock up the entire system? Because in those programs, memory is located on a magnetic chip set that must be accessed from the main memory. This is not always possible, due to the limited memory that is available to the operating system. In fact, if the entire memory is used up, then no program can use it anymore. When that happens, the operating system asks the RAM chip to give up the memory it has, but the RAM chip fails to do that since it is locked by other programs. It happens to users all the time, since they open very big files, and then have to reboot their machine. When memory becomes tight, programs try to access the memory, which is unavailable. As a result, the programs lock up and the system crashes. On a positive note, the program is free to work with big tables with no problems. KeyMACRO is a program that helps in preventing problems such as these. It eliminates problems such as these by employing the speed of your computer and your hard drive to optimize memory and speed up the work of your machine. The program has a free version, but the paid version is an absolute necessity. The free version is limited to 2048 names. KeyMACRO has great benefits. It is free, but it is not available for download. KeyMACRO is not a virus program, but it can help to eliminate viruses that come as email attachments. The program performs very well. It can even optimize the performance of your system. And for users who want the best, the paid version will come to their rescue. KeyMACRO is a simple and easy-to-use program. It is quick and efficient and runs in the background of your system and eliminates problems that might occur during the use of your system. KeyMACRO is compatible with Windows 8, 7, Vista and XP, and it works with all hard drives, since it can read and change the number of 512 bytes of memory that reside on the hard drive
